

APPENDIX 16—SOCIOECONOMIC DATA AND ASSUMPTIONS

Tables A16-1 to A16-3 show total full-time and part-time employment by industry for the study area, Wyoming, and the United States.

**Table A16-1. Total Full-Time and Part-Time Employment
by Industry in 1979, 1989, and 1999 for Study Area^a**

	1979	1989	1999
Total Full-Time and Part-Time Employment	45,028	41,545	49,048
Agriculture services, forestry, fishing, and other	186	326	550
Mining	10,595	5,664	4,846
Construction	4,832	2,383	3,964
Manufacturing	1,247	1,322	2,428
Transportation and public utilities	2,903	2,903	2,820
Wholesale trade	1,067	1,184	1,068
Retail trade	7,156	6,809	8,915
Finance, insurance, and real estate	1,650	2,102	2,441
Services	7,241	8,795	11,573
Farm employment	1,836	1,732	1,704
Government and government enterprises	6,315	8,325	8,739
Percentage of Total Employment			
Agriculture services, forestry, fishing, and other	0.4%	0.8%	1.1%
Mining	23.5%	13.6%	9.9%
Construction	10.7%	5.7%	8.1%
Manufacturing	2.8%	3.2%	5.0%
Transportation and public utilities	6.4%	7.0%	5.7%
Wholesale trade	2.4%	2.8%	2.2%
Retail trade	15.9%	16.4%	18.2%
Finance, insurance, and real estate	3.7%	5.1%	5.0%
Services	16.1%	21.2%	23.6%
Farm employment	4.1%	4.2%	3.5%
Government and government enterprises	14.0%	20.0%	17.8%
Growth in Employment by Sector	1979–1999	1979–1989	1989–1999
Total Full-Time and Part-Time Employment	8.9%	-7.7%	18.1%
Agriculture services, forestry, fishing, and other	195.7%	75.3%	68.7%
Mining	-54.3%	-46.5%	-14.4%
Construction	-18.0%	-50.7%	66.3%
Manufacturing	94.7%	6.0%	83.7%
Transportation and public utilities	-2.9%	0.0%	-2.9%
Wholesale trade	0.1%	11.0%	-9.8%
Retail trade	24.6%	-4.8%	30.9%
Finance, insurance, and real estate	47.9%	27.4%	16.1%
Services	59.8%	21.5%	31.6%
Farm employment	-7.2%	-5.7%	-1.6%
Government and government enterprises	38.4%	31.8%	5.0%

^a Study area includes Fremont, Sublette, and Sweetwater counties in Wyoming.

ECONOMIC IMPACT ANALYSIS METHODOLOGY

The following section provides a detailed summary of the economic impact analysis by resources use.

Oil and Gas Exploration and Development

The economic impact of oil and gas operations was analyzed in two phases:

- Phase I: Exploration and Development
- Phase II: Production.

Phase I considered how many exploratory and development wells would be drilled under each alternative in Jack Morrow Hills (JMH), and what percentage of these wells would be completed. This includes both conventional wells and coalbed methane development. Table A16-7 summarizes the economic assumptions used in analyzing the exploration and development phase associated with each alternative.

Table A16-7. Economic Assumptions for Gas Exploration and Development

	Gas Wells Drilled and Completed ^a (2001\$)	Gas Wells Drilled and Abandoned (2001\$)	Coalbed Methane Wells Drilled and Abandoned (2001\$)
Direct Expenditures	\$620,784	\$303,830	\$142,640
Total Economic Impact Per Well	\$847,180	\$413,090	\$193,957
Earnings Per Well	\$130,697	\$62,997	\$29,583
Jobs Per Well	4.395	2.121	0.996

a Conventional wells were assumed to average 9,000 feet in depth.

b Coalbed methane wells were assumed to average less than 5,000 feet in depth.

Phase II considered the economic impact of producing additional gas reserves as a result of the exploration and development under Phase I. This analysis considered only the production of gas reserves given the small amount of current and expected crude oil production within JMH. In addition, an economic benefit would be obtained from any coalbed methane production, but a production estimate could not be made at this time. Table A16-8 summarizes the economic assumptions used to analyze gas production estimated to occur under each alternative.

Table A16-8. Economic Assumptions for Gas Production

	Natural Gas (MCF) (2001\$)
Value of Production	\$2.81
Total Economic Impact	\$2,793
Earnings	\$188
Jobs	0.005387

The average price of natural gas used for this analysis was estimated with data from the Energy Information Administration, which published a 20-year gas price forecast for the Rocky Mountain Region (EIA 2001). This price forecast was adjusted for inflation and averaged more than 17 years (2003–2020) to estimate an average future price for gas production in JMH as summarized in Table A16-8.

Grazing

Grazing activities were analyzed under each alternative as follows. First, BLM was contacted regarding historical grazing use within JMH. Table 3-7 in the final EIS for the JMH CAP provides a summary of historical grazing use by operator for the last 5 years. The value of grazing animal unit months (AUM) for cattle and sheep was estimated as summarized in Tables A16-9 and A16-10. For cattle AUMs, as shown in columns 2 and 3, data were obtained from the Wyoming Agricultural Statistical Service and include the value of cattle sold in Wyoming each year between 1996 and 2000. Total cattle sales were divided by the number of cows that have calved in each year, which provided a value per cow sold as summarized in column 4. The value per cow was then divided by an AUM conversion factor, which resulted in an estimated value per AUM per year. This annual value was adjusted for inflation each year as summarized in column 7. The economic analysis used the 5-year average value of AUMs, or \$33.59/AUM in inflation-adjusted dollars.

Table A16-9. Estimated Value of Cattle AUMs

Year	Value of Production (1,000\$) ^a	Cows that have Calved (1,000 Head) ^a	Value Per Cow	AUM Conversion (AUMs/cow) ^b	Value of Production Per AUM (Nominal \$)	Value of Production Per AUM (Real 2001\$)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1996	\$359,805	810	\$444.20	16	\$27.76	\$30.36
1997	\$442,717	870	\$508.87	16	\$31.80	\$34.12
1998	\$400,637	880	\$455.27	16	\$28.45	\$30.10
1999	\$452,058	830	\$544.65	16	\$34.04	\$35.55
2000	\$490,707	830	\$591.21	16	\$36.95	\$37.80
5-year Average: \$33.59						

^a Wyoming Agricultural Statistics.

^b Workman, J.P. 1986. *Range Economics*. New York: McMillian Publishing, Inc.

A similar method was used to value sheep AUMs as summarized in Table A16-10. The value and number of AUMs per alternative were then used in combination with the input-output (I/O) model to estimate economic impacts of grazing under each alternative. The economic assumptions used to analyze grazing impacts are summarized in Table A16-11.

Table A16-10. Value of Sheep AUMs

Year	Value of Production Sheep and Lambs (1,000\$) ^a	Value of Wool Production (1,000\$) ^a	Total Value of Production	Ewes 1 Year and Older (1,000 Head) ^a	Value Per Ewe	Conversion to AUMs (AUMs/Ewe) ^b	Value of Production Per AUM (Nominal \$)	Value of Production Per AUM (Real 2001\$)

Recreation

Recreational impacts were analyzed as follows. The number of Recreational Visitor Days (RVD) was estimated for each alternative, considering several assumptions. These assumptions are summarized in Table A16-12. Once the number of RVDs was estimated by activity, the RVDs were separated into resident and nonresident use and analyzed. Residents were considered any individuals living in the three-county study area, whereas nonresidents lived outside the three-county region. Residents of the study area associated with big game hunting were determined by evaluating zip codes of hunters that applied for licensees from the Wyoming Game and Fish Department within the relevant hunting areas. This information is not available for upland species, so sage-grouse nonresidents include only out-of-state visitors. Residents and nonresidents participating in off-highway vehicle (OHV) and other dispersed use were based on observations of the BLM staff for this area. Resident and nonresident visits are summarized and explained in Section 3.4 (Table 3-21).

The economic impact of recreation in JMH considered activities only of nonresidents. This is based on the theory that nonresidents provide an economic stimulus to the area due to increased expenditures. Regional economic impact modeling (I/O models) evaluates the additional economic activity associated with “new” money brought into an economy. This can occur as goods and services are produced by local firms and exported to entities outside the region (e.g., agricultural products, oil and gas production). In addition, new money can come into an economy as visitors come to the area and spend money. I/O models estimate the additional economic activity that occurs with the new money expenditures. Therefore, nonresident spending is evaluated when determining the economic impacts of recreation. However, this does not imply that recreational activities are not important to the quality of life to residents in the area. Total annual recreational expenditures of nonresidents were estimated for each alternative using the estimated RVDs per activity and the average expenditures per day per activity. Table A16-13 summarizes the average expenditures used for each activity and summarizes other economic assumptions used to estimate the economic impact of recreation in JMH.

The Wyoming State Office Reservoir Management Group and Rock Springs Field Office report for lessee payments to the United States is included in this appendix for reference purposes.

Table A16-12. Recreation Assumptions

Use Type	No Action	Alternative 1	Alternative 2	Alternative 3	Proposed JMH CAP
Non-Consumptive					
OHV	OHV use is estimated to increase by 2.5% per year until 2010, when OHV use will remain constant until the end of study period. Increases in OHV use are expected as a result of improvements in facilities near Sand Dunes area.	OHV use is expected to increase by 2.5% per year until 2008, when OHV use will remain constant until the end of study period. Increases in OHV use are expected as a result of improvements in facilities near Sand Dunes area. OHV will not increase as much as No Action because of limits in access.	OHV use is expected to remain constant during first 5 years of study period, then decline by 10% during next 15 years because of limited access and no improvements in facilities near Sand Dunes area.	OHV use is expected to remain constant over the study period because of limited access and no improvements in facilities near Sand Dunes area	OHV use is estimated to increase by 2.5% per year until 2010, when OHV use will remain constant until the end of study period. Increases in OHV use are expected due to improvements in facilities near Sand Dunes area.
Other Recreational Uses	Nonconsumptive RVDs are estimated to increase by 1.5% per year over the next 20 years. Some recreational planning will occur under this alternative, but not at the same level of effort as for Alternatives 2 and 3. Limits on dispersed camping are not as strong under this alternative as with Alternatives 2 and 3, which will increase camping activities.	Nonconsumptive RVDs are estimated to increase by 1.5% over the next 5 years, then remain constant for the remainder of the study period. Recreational planning will occur under this alternative, but not at the same level as for Alternatives 2 and 3. Restrictions on dispersed camping are not as strong as under Alternatives 2 and 3. Recreation is not expected to increase throughout the study period because of increased development activities.	Nonconsumptive use is expected to increase by 1% per year over the study period. This is due to the increased recreational planning and interpretive prospectus development for several important sites. However, dispersed camping activities would be limited, restricting growth of this activity for this area.	Nonconsumptive use is expected to increase by 1% per year over the study period. This is due to the increased recreational planning and interpretive prospectus development for several important sites. However, dispersed camping activities would be limited, restricting growth of this activity for this area.	Nonconsumptive RVDs are estimated to increase by 2% per year over the next 20 years. This is due to the increased recreational planning and interpretive prospectus development for several important sites. Dispersed camping would not be limited as under Alternatives 2 and 3, which will allow for increased camping opportunities in the planning area.

Use Type	No Action	Alternative 1	Alternative 2	Alternative 3	Proposed JMH CAP
Consumptive					
Elk	Hunting days for elk are expected to remain constant at 5-year historic average for the entire planning period. Wyoming G&F will not increase the number of licenses, and changes in management should not significantly disrupt current hunting activities.	Hunting days for Elk are expected to increase 10% during the first 5 years of the study period because of increased development that is likely to disperse Elk in the planning area. During the second 5 years of the study period, hunting days are expected to fall as the herd objective is reached and development continues. The remaining years of the study period, hunting days for Elk are expected to remain constant.	Hunting days for Elk are expected to increase by 10% per year during the first 5 years of the study period, then remain constant for the rest of the study period. The increase follows recent trends in hunting days in the area. In addition, hunting days are expected to increase under this alternative because of access restrictions.	Hunting days for Elk are expected to remain constant at 5-year historic average for the entire planning period. Wyoming G&F will not increase the number of licenses, and changes in management should not significantly disrupt current hunting activities.	Hunting days for Elk are expected to remain constant at 5-year historic average for the entire planning period. Wyoming G&F will not be increasing the number of licenses, and changes in management should not significantly disrupt current hunting activities.
Antelope	Hunting days for antelope are expected to remain constant at the 5-year historic average during the study period.	Same as No Action	Same as No Action	Same as No Action	Same as No Action
Mule Deer	Hunting days for mule deer are expected to remain constant at the 5-year historic average during the study period.	Same as No Action	Same as No Action	Same as No Action	Same as No Action
Sage-Grouse	Hunting days for sage-grouse are expected to decline during the study period as population numbers fall.	Same as No Action	Hunting days for sage-grouse are expected to stay constant at current levels.	Same as No Action	Hunting days for sage-grouse are expected to stay constant at current levels.

Lessee Payments to the United States For Non-Producing Oil and Gas Leases in the Jack Morrow Hills

Summary

We prepared this report at the request of the Rock Springs Field Office, Assistant Field Manager and the Jack Morrow Hills Project Coordinator. We were asked to prepare an analysis to determine the payments that have been made to the United States to purchase and maintain leases in the Jack Morrow Hills area. A review of those payments is required in order to assist in the determination of the potential costs that would be associated with a proposed “lease buyback” recommendation for Alternative 2 of the Draft Jack Morrow Hills EIS. The Coordinator asked that the underlying assumption for this estimate would be that productive lands not be considered for any potential “lease buyback.”

This report summarizes only those payments made to the United States to purchase and maintain leases in the Jack Morrow Hills area. Those costs include payment of bonus bids, rentals, and application or filing fees. It does not review any other costs such as seismic acquisition and interpretation, business overhead, permitting, etc., that the lessee’s may have already incurred to manage and explore their leases. Also not reviewed in this report is an estimate of the potential hydrocarbon resource that the lessee may expect to develop if allowed. We believe that any complete estimate of lease buyback costs would also need to consider these items when negotiating with a potential willing seller.

We calculated lease payments on a dollar per acre basis for all active leases included in our study. We found that payments to date have ranged from a low of \$4.08 per acre for Lease WYW 147705 to a high of \$153.38 per acre for Lease WYW 135785. The average payment for the 204 leases included in this review has been \$21.50 per acre.

Criteria for Lease Exclusion

We used the Bureau of Land Management’s LR2000 online database (<http://lr2000.blm.gov/>) to access all active lease records for the Jack Morrow Hills area. The Coordinator had requested that producing leases be excluded from this analysis. We determined that “producing leases” are those that are Held By Production because they are in a producing unit (Buccaneer, Nitchie Gulch, Rim Rock, or Steamboat Mountain Unit) or Communitization Agreement or because they contain a producing well. Forty-two leases are Held By Production and those “producing leases” were excluded from our study.

The LR2000 database was created circa 1988, and consequently a complete history of payments was not available for all older leases. We were able to project payments back to issue date for some of the older leases, but could not project the entire rental history for all of them. Ten leases were excluded from analysis because we could not project their entire rental history. We found 204 leases, covering 230,693.34 acres, which could be used for analysis. A summary of all 204 leases is included in the attached table.

Lease Payments Made

Three types of payments may be made to the United States to purchase and maintain the right to develop oil and gas resources on federal lands in the Jack Morrow Hills area. The first payment that may be made is a lease bonus. Most of the 204 leases have been opened to a bidding process and 147 (72%) have been leased with a bonus bid. The other 57 were leased without a bonus bid. The minimum lease bonus bid allowed is \$2.00 per acre. Our LR2000 online database reports the winning bonus bid on a per acre basis. Those bids have ranged from \$2.00 to \$140.00 per acre (see “Bonus Bid” on attached table). We used the bonus bid to then calculate the “Lease Bonus Bid Paid” for the lands in each lease (see attached table). A total of \$2,347,749 in lease bonus bids has been paid.

The second payment made on the 204 leases is an annual rental. The annual rental is paid unless a suspension has been approved. Lease segregation, assignment, and relinquishment affect the total acres within a lease and consequently the rental paid. The LR2000 records of rental payments had to be adjusted where lease acre changes due to segregation, assignment, and relinquishment had been made. A “Lease Rental Paid” calculation was made for each lease (see attached table). Individual lease rentals have ranged from \$180 to \$82,930.50. A total of \$2,612,316.06 in rental has been paid to date on the 204 active leases reviewed in the Jack Morrow Hills area.

The third payment made is an application or filing fee. We have assumed that this fee averages \$75 per lease, or \$15,300 for the 204 leases.

The per acre amount paid to the government, to date, for each lease is calculated as follows:

$$\text{Lease Bonus Bid Paid} + \text{Lease Rental Paid} + \text{Application Fee} / \text{Lease Acres}$$

Our calculations show that payments to date have ranged from \$4.08 per acre to \$153.38 per acre (see attached table). The average payment for the 204 leases included in this review has been \$21.50 per acre.
